

NOTES 6.5 & 6.6 - INEQUALITIES IN ONE AND TWO TRIANGLES

Objective: I can use theorems to order sides & angles & find a range of values for possible measures.

THEOREM	DIAGRAM
TRIANGLE LONGER SIDE THEOREM If one side of a triangle is longer than another side, then the angle opposite the longer side is larger than the angle opposite the shorter side.	<p>$AB > BC$, so $m\angle C > m\angle A$</p>
TRIANGLE LARGER ANGLE THEOREM If one angle of a triangle is larger than another angle, then the side opposite the larger angle is longer than the side opposite the smaller angle.	<p>$m\angle A > m\angle C$, so $BC > AB$</p>
TRIANGLE INEQUALITY THEOREM The sum of the lengths of any two sides of a triangle is greater than the length of the third side.	<p>$AB + BC > AC$ $AC + BC > AB$ $AB + AC > BC$</p> <p><i>*All must be true or else cannot form.*</i></p>

EXAMPLES:

1. Write the angles in order from smallest to largest. $m\angle C < m\angle A < m\angle B$	
2. Write the sides in order from shortest to longest. $AB < AC < BC$	
3. Tell whether a triangle can have sides with the given lengths. Is $a+b > c$? 3, 5, 8 $3+5 > 8$ $a < b < c$ $8 > 8$ No!	4. Tell whether a triangle can have sides with the given lengths. Is $a+b > c$? 11, 15, 21 $11+15 > 21$ $a < b < c$ $26 > 21$ Yes!

**Only have to check if the 2 smaller sides added together is greater than the largest side!*

- Finding the Range of Values:
 Step 1: ADD the two sides
 Step 2: Take the positive DIFFERENCE of the two sides (SUBTRACT)
 Step 3: Write the inequality: difference $< x <$ addition

EXAMPLES:

5. Find the range of values for x if the side lengths of a triangle are 4, 19 and x . $4+19 = 23$ $19-4 = 15$ $15 < x < 23$	6. Find the range of values for x if the side lengths of a triangle are 2, 7 and x . $2+7 = 9$ $7-2 = 5$ $5 < x < 9$
---	--

INEQUALITIES IN TWO TRIANGLES

THEOREM	DIAGRAM
HINGE THEOREM If two sides of one triangle are congruent to two sides of another triangle, and the included angle of the first is larger than the included angle of the second, then the third side of the first is longer than the third side of the second.	<p>$XW > TS$</p>
CONVERSE OF THE HINGE THEOREM If two sides of one triangle are congruent to two sides of another triangle, and the third side of the first is longer than the third side of the second, then the included angle of the first is larger than the included angle of the second.	<p>$m\angle C > m\angle F$</p>

7. $BC < EF$	
8. $m\angle A < m\angle D$	

13. $AB > AC$

14. $m\angle 1 > m\angle 2$

You can use the Hinge Theorem and its converse to find a range of values in two triangles.

Step 1: Compare the side lengths in the triangle.

$$2 < 3$$

So, $2x-3 < x+7$ (substitute the angles)

$$x < 10$$

Step 2: Check that the measures are possible for a triangle (sides and angles must be > 0)

$$\text{(Substitute both angles or sides)} \quad 2x-3 > 0$$

$$2x > 3$$

$$x > \frac{3}{2}$$

$$x+7 > 0$$

$$x > -7$$

Take the larger of the two values for the next step.

Step 3: Combine the inequalities (Step 1 $\# < x <$ Step 2 $\#$)

$$\frac{3}{2} < x < 10$$

EXAMPLES: Write and solve an inequality for the possible values of x .

15.

$$14x-10 < 6(x+1)$$

$$14x-10 < 6x+6$$

$$8x < 16$$

$$x < 2$$

$$14x-10 > 0$$

$$14x > 10$$

$$x > \frac{5}{7}$$

$$x > -1$$

16.

$$3x-18 < 2(x+22)$$

$$3x-18 < 2x+44$$

$$x < 62$$

$$3x-18 > 0$$

$$2x+44 > 0$$

$$2x > -44$$

$$x > -22$$

$$6 < x < 62$$
